DETAILED ACTION

Claim Objections

1. Claim 5 is objected to under 37 CFR 1.75(c) as being in improper form because a multiple dependent claim cannot depend upon another multiple dependent claim. See MPEP § 608.01(n). Accordingly, claim 5 has not been further treated on the merits.

Claim Rejections - 35 USC § 112

2. Claims 1-4 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

In claim 1, the recitation of the metallic soap is awkward and confusing. Do applicants intend a metallic soap comprising a "monovalent or divalent metal salt of an aliphatic carboxylic acid of 20 to 25 carbon atoms"?

In claim 3, no difference is seen between the generic "filler" and the metal soap of the base claim. This is particularly so since the filler includes lubricants as per claim 4.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. Claims 1-4 are rejected under 35 U.S.C. 103(a) as being unpatentable over U.S. 5,183,843 (Sakai et al).

Sakai et al disclose a polyamide resin composition comprising A) an aromatic polyamide, reading on applicants' component A, B) a fibrous reinforcement, reading on applicants' filler per claim 3, and C) at least one additive which includes a higher fatty acid metal salt, embracing the presently claimed component B. The higher fatty acid metal salts usable include metals salts of behenic acid (22 carbon atoms) and the like (column 6, lines 7-11).

In essence, the disclosure of Sakai et al differs from the presently claimed subject matter in not expressly exemplifying a metal salt of an aliphatic acid of 20 to 25 carbon atoms. It is maintained that it would been obvious to one having ordinary skill in the art to have formulated a polyamide composition of the reference using a higher fatty acid metal salt meeting the terms of the present claims because said salt is an obvious species of the reference's general disclosure. Accordingly, absent evidence of unusual or unexpected results, no patentability can be seen in the presently claimed subject matter.
